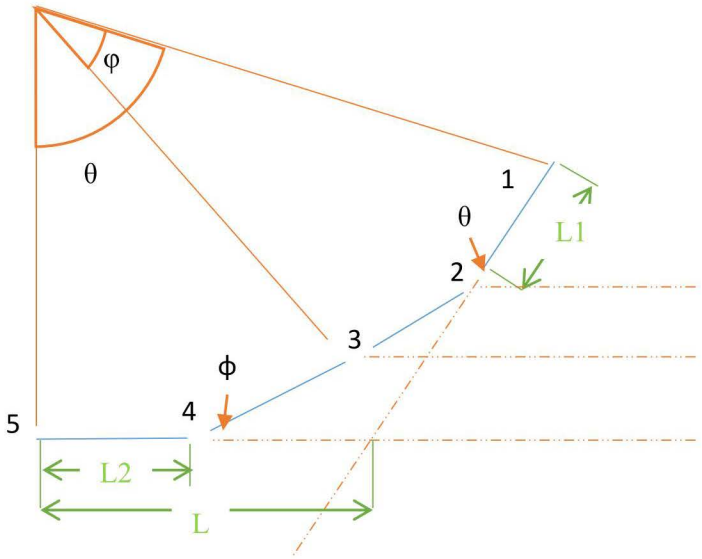
Derivation of the Breaking an Elbow with an Arbitrary Angle at an Arbitrary Angle

Michael Fletcher



A bend of radius R and of bend angle θ is to be split at angle ϕ for analysis.

Length from center of bend to end of bend. (Note: L to be substituted in 45° bends to match ASME B16.9 as needed.)

$$L = R \cdot tan\left(\frac{\theta}{2}\right)$$

Sum of the horizontal components:

$$L_{12}cos(\theta) + L_{23}cos(\varphi) + L_{34}cos(\varphi) + L_{45}cos(\varphi) = L + Lcos(\theta)$$

Sum of vertical components:

$$L_{12}sin(\theta) + L_{23}sin(\varphi) + L_{34}sin(\varphi) = Lsin(\theta)$$

With the caveat:

$$L_{12} = L_{23} = L_1, L_{34} = L_{45} = L_2$$

Simplifying:

$$L_1\big(cos(\theta) + cos(\varphi)\big) + L_2\big(cos(\theta) + cos(\varphi)\big) = L\big(1 + cos(\theta)\big)$$

$$L_1\big(sin(\theta) + sin(\varphi)\big) + L_2sin(\varphi) = Lsin(\theta)$$

$$L_1 = \frac{L\big(1 + cos(\theta)\big) - L_2\big(cos(\theta) + cos(\varphi)\big)}{cos(\theta) + cos(\varphi)}$$

Substituting:

$$\left(\frac{L\big(1 + cos(\theta)\big) - L_2\big(cos(\theta) + cos(\varphi)\big)}{cos(\theta) + cos(\varphi)}\right)\big(sin(\theta) + sin(\varphi)\big) + L_2sin(\varphi) = Lsin(\theta)$$

$$\Big(L\big(1 + cos(\theta)\big) - L_2\big(cos(\theta) + cos(\varphi)\big)\Big)\frac{sin(\theta) + sin(\varphi)}{cos(\theta) + cos(\varphi)} + L_2sin(\varphi) = Lsin(\theta)$$

$$L\big(1 + cos(\theta)\big)\frac{sin(\theta) + sin(\varphi)}{cos(\theta) + cos(\varphi)} - L_2\big(cos(\theta) + cos(\varphi)\big)\frac{sin(\theta) + sin(\varphi)}{cos(\theta) + cos(\varphi)} + L_2sin(\varphi) = Lsin(\theta)$$

$$L_2sin(\varphi) - L_2\big(cos(\theta) + cos(\varphi)\big)\frac{sin(\theta) + sin(\varphi)}{cos(\theta) + cos(\varphi)} = Lsin(\theta) - L\big(1 + cos(\theta)\big)\frac{sin(\theta) + sin(\varphi)}{cos(\theta) + cos(\varphi)}$$

$$L_2\left(sin(\varphi) - \big(cos(\theta) + cos(\varphi)\big)\frac{sin(\theta) + sin(\varphi)}{cos(\theta) + cos(\varphi)}\right) = Lsin(\theta) - L\big(1 + cos(\theta)\big)\frac{sin(\theta) + sin(\varphi)}{cos(\theta) + cos(\varphi)}$$

$$L_2\big(-sin(\theta)\big) = Lsin(\theta) - L\big(1 + cos(\theta)\big)\frac{sin(\theta) + sin(\varphi)}{cos(\theta) + cos(\varphi)}$$

$$L_2 = L\left(\frac{\big(1 + cos(\theta)\big)}{sin(\theta)}\frac{sin(\theta) + sin(\varphi)}{cos(\theta) + cos(\varphi)} - 1\right)$$

Notes:

- Bends shall be specified at points 2 and 4 only. The radius of both bends is R.
- L12 and L45 must be at least this long. They may be longer, but any excess of this value will be straight piping.
- An error message may appear as you apply a bend at these locations if you specify minimum lengths, and CAESAR automatically attempts to place a node at this location when you apply the bend modifier.
- The mathematics above assumes that L45 is oriented along a primary axis. It may be necessary to temporarily re-orient the entire model or sections of the model in order to work the math out.
- Only one break is considered, but the logic can be extended to multiple breaks. For example, instead of a 30° bend broken at 10° and 20°, you can think of it as two 15° bends broken at 10° and 5°. The second 15° bend must, however, be rotated 15° relative to the first 15° bend to act as a continuous 30° bend.
